Aqualine™ Colorants for In Plant Use

Aqualine™ is the latest 'in plant tinting' technology, designed from scratch as an in plant tinting system utilising colorants rather than pastes or liquid dispersions. For this reason Aqualine™ delivers the ultimate in colour production quality and colour batch production advantages. The colorants can be used either gravimetrically, such as traditional in plant pastes, but are controlled volumetrically and are machine stable and therefore also suitable for use in production tinting machines.

Aqualine™ technology is water borne, VOC free and utilises the latest water borne chemistry to ensure adverse effects often seen with traditional 'production pastes' are practically eliminated. Innovative system design, working from a core selection to provide high performance combined with an additional commercial selection of pigments ensures the range can be utilised in all areas of batch colour production.

Aqualine™ provides a total in plant solution, including transparent iron oxides and combines a matching database and reduces the differences traditionally seen between colour production in factory and point of sale tinting. Aqualine™ colorants are also suitable for production of coloured tinting bases for point of sale systems.

Advantages

- Highly controlled colorants
- Highly pigmented
- High performance combined with commercial selection of pigments
- VOC Free
- High Strength
- Machine Stable
- Volumetrically or Gravimetrically controlled
- Complete with matching database

Benefits

- Batch to batch consistency
- Reduce production time
- Eliminate batch to batch metamerism
- Eliminate metamerism between 'factory made' and POS produced colours
- Stability for use in 'in plant' tinting machine
- Reduction in waste - produce exactly what batch size is required
- Increase capacity
- Reduced QC time
- Reduce costs
- Shakeable' packaging
- Complete in plant system
- Commercially competitive
